

INVESTOR MEMORANDUM · SUMMER 2026 · CONFIDENTIAL

An investor memorandum for Lumecon.

Software-first economic impact analysis for the organizations the current market underserves. Built for governments, tribal nations, nonprofits, universities, foundations, enterprises, and the consultants who serve them.

Lumecon Inc. · A Delaware Corporation · lumecon.ai

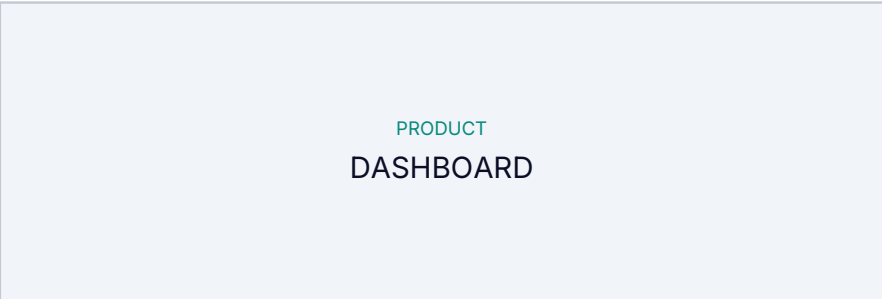

EXECUTIVE SUMMARY

Executive Summary

Lumecon is the software platform that makes economic impact analysis accessible to the organizations the current market underserves. The category is proven, the entry point is the most technically demanding segment of it, and the underlying technology shift makes building this company possible now in a way it was not five years ago.

Make the economically invisible visible.

The company is currently raising up to \$100,000 in SAFE financing at a \$5,000,000 post-money valuation cap to accelerate product development, pilot implementation, intellectual property protection, and commercialization. The founders have personally committed \$50,000 in capital, with \$25,000 already deployed.

Lumecon dashboard. A completed economic impact run with jobs, labor income, output, tax impact, and export options on a single screen.

INVESTMENT SUMMARY

Investment Summary

Item	Description
Company	Lumecon Inc.
Entity Type	Delaware C-Corporation
Financing Instrument	Y Combinator Post-Money SAFE (Valuation Cap, No Discount)
Valuation Cap	\$5,000,000 Post-Money
Raise Target	Up to \$100,000
Founder Capital Committed	\$50,000
Founder Capital Deployed	\$25,000
Company Founded	January 2026
Corporate Conversion	May 2026

WHY NOW

Why Now

Three things converged in the last 24 months that make this company possible to build now.

AI can do the repetitive part of professional knowledge work. Recent labor-economics research finds that the share of professional work theoretically exposed to current AI systems substantially exceeds what is being adopted in practice. Economic impact analysis sits in that gap. The work is heavy on document intake, harmonization, assumption tracking, charting, and report writing, all of which are on the productive side of the adoption curve.

Existing providers have not modernized. IMPLAN and REMI operate on workflows that predate the cloud. The market leaders prove demand and validate willingness to pay, but their stacks were built when desktop software was the assumption. The gap between what current technology

can support and what shipped product offers is unusually wide.

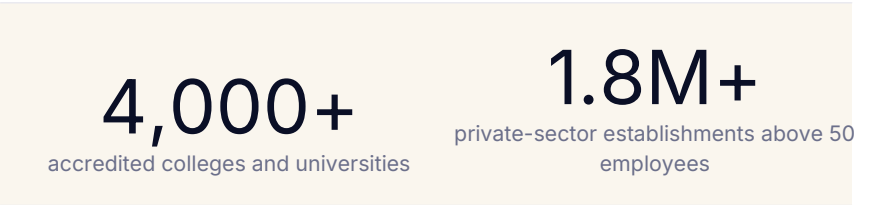

Customers want experts plus AI, not black-box outputs. Governments, tribes, foundations, and grantmakers cannot accept a number they cannot defend. Lumecon sits between AI-only tools and traditional consultants. AI handles intake, harmonization, and drafting; the analyst stays accountable for every assumption.

This is not a "use AI for X" story. It is a "modernize a stagnant category" story where AI is one of several enabling shifts.

MARKET OPPORTUNITY

Market Opportunity

The addressable customer set is large, recurring, and fragmented enough that no single incumbent has consolidated it.

Existing providers serve more than 1,100 organizations between IMPLAN (900+) and REMI (200+). Charlesbank Capital Partners acquired IMPLAN in 2024, confirming category demand and acquisition interest. The customer counts above demonstrate willingness to pay, not the boundary of the market. Most of the organizations listed have never run an economic impact study because the practical cost of one is \$25,000 to \$100,000 once software, consulting, and internal staff time are added together. Lumecon's pricing structure breaks below that floor and turns one-time studies into a continuously refreshed planning tool.

THE PROBLEM

The Problem

Economic impact analysis today is a months-long project with a five-figure-per-study price tag. Lumecon turns the same work into a repeatable software workflow.

LEGACY WORKFLOW

Months of consultant time.

Hire a consultant or open a desktop software license.

Collect data manually from spreadsheets and PDFs.

Clean and harmonize inputs by hand.

Pick multipliers; document assumptions in the report margin.

Build charts. Write the report. Format the deck.

Revise. Re-run. Bill again for the next update.

LUMECON WORKFLOW

Minutes of platform time.

Open the workspace.

Upload PDFs, CSVs, and XLSX files into Cedar.

Cedar structures inputs against public data sources.

Review every assumption Cedar surfaces; approve or override.

Export the branded report, deck, and executive summary.

Refresh quarterly. Same workspace. No re-engagement.

The legacy stack charges per geography, per user, per data tier. Then the consultants who operate it charge by the hour, with junior analysts

running the model and senior analysts writing the report. Update cycles bring the bill back every time the data needs to be refreshed.

Lumecon collapses both layers. One annual subscription, unlimited studies, every geography included, Cedar handling the intake and the drafting, and human review focused on the judgment calls that actually need a human.

PRODUCT
STUDY SETUP

New study setup. Pick the geography, the time window, the project type, and the data sources, and Cedar prepares the workspace.

WHY TRIBES FIRST

Why Tribes First

Tribal economies are among the most difficult economic environments to model accurately in the United States. Reservations, off-reservation trust lands, overlapping jurisdictions, sovereign governments, rural geography, Alaska Native Corporation regions, Native Hawaiian Home Lands, and Indigenous data sovereignty requirements together create a problem that the major incumbents handle by approximating reservations as counties and hoping nobody asks.

Solving these problems first creates infrastructure that deploys directly into broader markets. The geographic engine, the data sovereignty controls, the institutional flexibility, and the multi-jurisdictional reasoning are exactly what cities, foundations, federal agencies, and international clients need. Tribes are the strategically right entry point because they force the hardest version of the problem to be solved first.

The same review that identified 50+ public tribal impact studies between 2000 and 2026 also showed several organizations commissioning studies repeatedly, which means tribal demand is recurring rather than one-time. That recurring footprint is the early-customer base that funds the broader expansion.

PRODUCT
GEOGRAPHY SELECTOR

Geography selector. Reservation, off-reservation trust land, Alaska Native regional and village corporations, and Native Hawaiian Home Lands as first-class geographies.

PRODUCT

Product

Three regional platforms on one engine. Local Economic Impact for cities, counties, and state agencies. Tribal Economic Impact for tribal governments, enterprises, and Native organizations. Global Economic Impact, launching in 2028, for cross-border and supply-chain analysis. Every platform runs the same modeling backbone and the same three-tier ladder (Sprout, Sapling, Tree).

Cedar. Lumecon's AI-assisted workflow. Cedar uploads and processes data in PDF, CSV, and XLSX formats today, with more formats expanding over time. It structures inputs against public data sources, surfaces every modeling assumption for human sign-off, and acts as a thought partner on the write-up. Cedar is not a ghostwriter. The analyst stays accountable for the substance.

PRODUCT
CEDAR UPLOAD

Cedar upload and review queue. Drop in PDFs, CSVs, and XLSX files; Cedar extracts fields and stages them for human review.

Cedar Grove. Launches in 2027 as the organizational intelligence layer. Customer data stays harmonized across every study a customer runs. Complementary administrative datasets (employment shifts, business openings and closures, wage movements, transfer-payment flows) sit alongside the customer's own data, so each study reinforces the impact narrative with real outcome evidence rather than only modeled multipliers. Recurring submissions (grants, federal reporting, audited annual reports) start from a base that already passed review.

Arborist and Toolbox. Arborist is the consultant plan, project-based, \$15,000 flat for two projects in one engagement, renewable as a fresh engagement when those wrap up. Toolbox is a \$15,000 add-on that pairs the platform with our team for finished publication-ready deliverables.

THE MOAT

The Moat

The defensibility is layered, and each layer compounds on the one below it.

Layer 1. Tribal and Native-economy expertise. Founders and senior team members carry direct experience at the Federal Reserve Bank of Minneapolis Center for Indian Country Development, the National Congress of American Indians, and through original work like the Native Entity Enterprise dataset. The category leaders do not have this expertise

and cannot acquire it quickly.

Layer 2. Complex-geography engine. Reservations, trust lands, congressional districts, economic development zones, service areas, watersheds, and multi-jurisdictional regions are first-class geographies. This is infrastructure that is hard to retrofit into legacy systems.

Layer 3. Reusable data infrastructure. Cleaning and harmonizing public, alternative, and administrative datasets happens once. Every customer benefits. Every new dataset added widens the lead.

Layer 4. Cedar Grove and customer switching costs. Once a customer has built up a harmonized data layer, a curated source library, an assumption history, and recurring report templates inside Cedar Grove, switching providers means rebuilding institutional memory. The longer a customer is on the platform, the more expensive that decision becomes.

Layer 5. Privacy-preserving learning, on the roadmap. The architecture is designed to support federated learning so models can improve from cross-customer signals without raw data ever leaving a customer's workspace. This preserves Indigenous data sovereignty by design and creates a network effect that is hard to replicate without the same architectural commitments.

Patents, trademarks, copyrights, and trade secret protections sit on top of these layers as a procedural moat, not the primary one.

ROADMAP

Roadmap

2026	Local Economic Impact launches. Coverage: county, state, national.
2026	Tribal Economic Impact launches. Coverage: reservation, county, state, national.

2026	Cedar launches as the AI workflow inside Sapling and Tree tiers.
2027	Cedar Grove launches as the organizational intelligence layer on Tree.
2028	Global Economic Impact launches. National, international, cross-border, and supply-chain analysis.

REVENUE MODEL

Revenue Model

Local Economic Impact

Tier	Annual price
Sprout	\$7,500
Sapling	\$15,000
Tree	\$20,000

Tribal Economic Impact

Tier	Annual price
Sprout	\$10,000
Sapling	\$17,500
Tree	\$25,000

Arborist. \$15,000 flat for two projects in one engagement, renewable as a fresh engagement when those wrap up. Built for consulting firms.

Toolbox. \$15,000 add-on. Team-produced finished deliverables with three rounds of revisions, recommended pairing with the Tree tier so deliverables pick up the customer's custom branding automatically.

PRODUCT
REPORT PDF

Exported PDF report. Branded to the customer's visual identity with the assumption ledger embedded.

PRODUCT
DECK EXPORT

Exported slide deck. Same numbers, different framing, ready for council, board, or funder audiences.

USE OF FUNDS

Use of Funds

Category	Amount	Detail
Engineering	\$35,000	Platform development, product refinement, customer features.
Infrastructure	\$15,000	Cloud computing, storage, monitoring, security.
Intellectual property	\$15,000	Patents, trademarks, copyrights.

Data	\$10,000	Alternative data acquisition and licensing.
Commercialization	\$15,000	Pilot implementation, customer onboarding, sales and marketing.
Legal and compliance	\$10,000	Corporate governance, customer contracting, financing.
Total	\$100,000	

TEAM

Team

Investors invest in teams. This one is the strongest part of the company.

CO-FOUNDER & CEO

Elijah Moreno, MPP

Cornell PhD candidate in Public Policy. Dartmouth Economics with Native American Studies. Cornell MPP. Federal Reserve Bank of Minneapolis (Center for Indian Country Development). National Congress of American Indians (Wilma Mankiller Fellow). Taylor Policy Group. Built the Native Entity Enterprise dataset and the leading body of empirical work on tribal federal contracting.

ECONOMICS LEAD

Laurel Wheeler, PhD

Duke PhD in Economics. Oxford MSc in Economics for Development. Federal Reserve Bank of Minneapolis (Center for Indian Country Development) economist. Published work on Native CDFI lending, financial inclusion, and the economics of tribal credit.

INPUT/OUTPUT ENGINE LEAD

Isabella Agnes

University of Wisconsin–Madison (Mathematics and Economics). Doctoral training in Economics at the University of Maryland. Federal Reserve Board of Governors data scientist. Federal Reserve Bank of Philadelphia research assistant.

CEDAR LEAD

Francesca Agnes

University of Illinois Urbana-Champaign. Leads Cedar, Lumecon's AI workflow for organizing source records and surfacing assumptions.

PLATFORM LEAD

Kaylyn Lee

Cornell University Computer Science with Business. Leads the customer-facing platform, from data upload through report export.

METHODOLOGY ADVISOR

Vod Vilfort

MIT PhD candidate in Economics with a focus on econometrics. Yale undergraduate in Economics and Mathematics. Published in American Economic Review: Insights on instrumental-variable estimators in information-provision experiments.

TECHNICAL ADVISOR

Brian Kim

Dartmouth Economics. Senior software engineer at Mody and Chime. Advises on architecture, scalability, Cedar's AI workflow, and data security.

PRODUCT, DATA SECURITY & RESEARCH OPERATIONS ADVISOR

Havala Hanson, PhD

University of Alaska Fairbanks PhD in Statistics and Policy in Education. Brown University MA. Extensive experience designing data governance and security procedures for sensitive administrative datasets.

CO-FOUNDER & FOUNDING INVESTOR

Michael Moreno

Moved the company from concept to product through founding capital and early-stage support.

CORNELL · DARTMOUTH · YALE · DUKE · MIT · OXFORD · BROWN · UNIVERSITY OF WISCONSIN–MADISON · UNIVERSITY OF MARYLAND · UNIVERSITY OF ALASKA FAIRBANKS · FEDERAL RESERVE SYSTEM · CENTER FOR INDIAN COUNTRY DEVELOPMENT

CLOSING

Closing

Economic impact analysis is a proven category with stagnant incumbents, a customer base limited by price rather than need, and an underlying technology shift that makes the next generation of platforms possible to build. The strategically correct entry point is the segment that current providers handle worst, which is tribal economies and the complex geographies that come with them. Solving for that segment produces infrastructure that deploys directly into the rest of the market.

The question is no longer whether economic impact analysis matters. The question is who has access to it.

Make the economically invisible visible.
