

INVESTOR MEMORANDUM SUMMER 2026 CONFIDENTIAL AND PROPRIETARY

An investor memorandum for Lumecon.

Lumecon is building the next generation of economic impact analysis software. Software-first. AI-assisted. Expert-reviewed. Built for the organizations the legacy market leaves out.

LUMECON.AI

INVESTOR MEMORANDUM SUMMER 2026 CONFIDENTIAL AND PROPRIETARY

Executive Summary

Lumecon is building the next generation of economic impact analysis software.

Governments, tribal nations, nonprofits, universities, foundations, enterprises, and consultants spend tens of thousands of dollars and hundreds of labor hours producing economic impact studies. Software, cloud computing, AI, and data infrastructure have all advanced. The industry still relies on workflows that would be familiar twenty years ago. Downloading spreadsheets. Cleaning data manually. Documenting assumptions by hand. Building charts. Writing reports. Formatting deliverables.

The market is expensive, consultant-dependent, and inaccessible to many organizations that would benefit from economic impact analysis.

Lumecon exists to change that.

Our mission is simple.

Make the economically invisible visible.

We are building a software platform that combines economic modeling, AI-assisted workflows, reusable data infrastructure, automated reporting, and expert review. The goal is to drop the cost and complexity of economic impact analysis by an order of magnitude.

We are not just competing with existing providers.

We are expanding the market.

The Opportunity

Economic impact analysis is already a proven market.

Organizations commission studies to justify public investments, secure grant funding, support legislative advocacy, communicate community benefits, evaluate programs, satisfy reporting requirements, and demonstrate economic value.

Existing providers prove demand exists.

IMPLAN reports serving more than 900 organizations. Charlesbank Capital Partners acquired it in 2024.

REMI reports serving more than 200.

That demand is real. It is also undercounted.

Most current customers are organizations that can afford expensive software licenses, consultant support, or both. Many organizations that need economic impact analysis are effectively excluded from the market because the total cost is too high.

Software licenses range from roughly \$7,500 to more than \$65,000 a year. Many organizations then bring in consultants to operate those systems. That adds \$25,000 to \$100,000 or more per project.

Many potential customers simply never enter the market.

The real opportunity is larger than existing customer counts suggest.

Why Now

AI has opened a rare gap between technological capability and institutional adoption.

Recent research finds that many professional occupations have substantial theoretical exposure to AI. Actual adoption is well below what current systems can support.

Economic impact analysis sits directly in that gap.

Organizations want efficiency, automation, and lower costs. They also need transparency, documentation, methodological rigor, and expert oversight.

They do not want black-box outputs.

They want tools that make experts more productive.

Lumecon is built around that reality. We are not replacing economists, analysts, consultants, or policy professionals. We are letting them operate at much larger scale.

Software First

Lumecon is a software company.

Our primary objective is not consulting revenue. Our primary objective is building infrastructure.

The traditional workflow burns substantial labor on collecting data, cleaning spreadsheets, harmonizing inputs, documenting assumptions, building charts, designing reports, formatting presentations, and revising deliverables.

Much of that is necessary.

Much of it is also repetitive.

Lumecon is productizing those workflows. We are building systems that automate or accelerate data ingestion, geography matching, harmonization, assumption tracking, chart generation, report generation, slide generation, visual branding, and documentation.

Human review stays essential.

The goal is not to eliminate expertise.

The goal is to point expertise at the work where it creates the most value.

Why Tribal Markets

Our initial focus is tribal economic impact analysis.

Not because the tribal market is small. Because it is one of the most technically challenging economic measurement environments in the United States.

Reservations. Trust land. Overlapping jurisdictions. Indigenous data sovereignty. Rural economies. Unique institutional structures. Most existing systems do not address these well.

Our internal review identified more than fifty publicly available tribal economic impact studies commissioned between roughly 2000 and 2026. Demand has grown over time. The public record likely understates true demand because many tribal studies stay internal. Several organizations appear repeatedly. That suggests recurring demand rather than one-time purchases.

Tribal Economic Impact is both a meaningful market opportunity and a strategic entry point.

If we solve the hardest geographic and institutional problems first, broader expansion gets substantially easier.

Product Roadmap

2026 • Local Economic Impact.

County, state, and national economic impact analysis for governments, universities, nonprofits, foundations, and enterprises.

2026 • Tribal Economic Impact.

Reservation-focused economic impact analysis designed around tribal institutions and Indigenous data sovereignty.

2026 • Cedar.

Lumecon's AI-assisted workflow and agent system. Cedar helps users organize source materials, structure inputs, document assumptions, manage workflows, and generate analysis-ready outputs.

2027 • Cedar Grove.

A compliance, data harmonization, and organizational intelligence layer. Cedar Grove helps organizations maintain institutional memory and simplify recurring reporting requirements.

2028 • Global Economic Impact.

Expansion into national, international, cross-border, and supply-chain analysis. Most early customers will be in the United States. Long-term international demand is significant.

Business Model

Lumecon generates revenue through software subscriptions, consultant access, and optional service layers.

Local Economic Impact

Tier	Annual price
Sprout	\$7,500
Sapling	\$15,000
Tree	\$20,000

Tribal Economic Impact

Tier	Annual price
Sprout	\$10,000
Sapling	\$17,500
Tree	\$25,000

Arborist

A consultant-focused plan. \$15,000 for two projects.

Consultants are not just competitors. They are also customers. Arborist lets consulting firms use Lumecon's modeling infrastructure while keeping Cedar, Cedar Grove, and other workflow advantages reserved for direct

subscribers.

Toolbox

A \$15,000 add-on. Converts platform outputs into publication-ready deliverables: a full written report, a presentation deck, an executive summary, an assumption ledger, source documentation, and a media-ready findings sheet.

Competitive Advantages

Several advantages are difficult to replicate.

Combined expertise.

Most AI companies lack deep economic modeling expertise. Most economic impact providers are not building modern software. We do both.

Underserved customers.

We are focused on organizations the existing platforms do not serve, not only on the customers those platforms already have.

Reusable infrastructure.

Our data and workflow layers improve over time. Cedar and Cedar Grove compound across studies in ways one-off consulting cannot.

Workflow advantages beyond modeling.

Cedar and Cedar Grove extend Lumecon's value beyond the impact figure itself. They handle the intake, the assumption ledger, the harmonization, and the reusable institutional memory that the rest of the industry leaves to spreadsheets.

Hard geographies, handled.

Reservations, congressional districts, service areas, and other non-standard geographies are core to our platform, not edge cases.

Alternative data on the roadmap.

We plan to integrate mobility, satellite, shipping, utility, and administrative datasets over time.

Protected by design.

We intend to protect proprietary systems, methods, workflows, and software through patents, copyrights, trademarks, trade secret protections, and contractual safeguards where appropriate.

Team

Lumecon combines expertise from Cornell University, Dartmouth College, Yale University, Massachusetts Institute of Technology, Duke University, Oxford University, Brown University, and the Federal Reserve System.

The team includes economists, econometricians, software engineers, policy researchers, statisticians, and experts in tribal economic development, public finance, and data governance.

Use of Funds

SAFE proceeds will support engineering, cloud infrastructure, AI development, Cedar, Cedar Grove, economic modeling, data infrastructure, pilot implementation, commercialization, intellectual property protection, and legal and compliance activities.

Closing

Economic impact analysis is a proven market.

The challenge is not whether organizations need it.

The challenge is that too many organizations cannot access it efficiently.

Lumecon is building the infrastructure layer that makes economic impact analysis more affordable, more transparent, more scalable, and easier to update.

The future of economic impact analysis will be software-driven, AI-assisted, expert-reviewed, and continuously improving.

Our goal is not just to produce economic impact studies.

Our goal is to build the platform that powers them.
