

INVESTOR MEMORANDUM · SUMMER 2026 · CONFIDENTIAL

An investor memorandum for Lumecon.

Software-first economic impact analysis for the organizations the current market underserves. Built for governments, tribal nations, nonprofits, universities, foundations, enterprises, and the consultants who serve them.

Lumecon Inc. · A Delaware Corporation · lumecon.ai

EXECUTIVE SUMMARY

Executive Summary

Lumecon Inc. is a Delaware corporation building economic impact analysis software for governments, enterprises, tribal nations, and mission-driven organizations.

Our mission is simple.

Make the economically invisible visible.

Every day, governments, nonprofits, tribal nations, universities, enterprises, and foundations create jobs, support families, improve infrastructure, expand educational opportunity, and strengthen communities. Many of those organizations still struggle to quantify and communicate the full extent of that impact. Lumecon is the software that solves it. We combine modern infrastructure, transparent economic modeling, AI-assisted workflows, alternative data integration, and forthcoming privacy-preserving learning architectures to make sophisticated economic impact analysis accessible to organizations the current market underserves.

The company is currently raising up to \$100,000 in SAFE financing to accelerate product development, support pilot implementation, strengthen intellectual property protection, and expand commercialization. The full form of the SAFE appears as an appendix to this memorandum.

INVESTMENT SUMMARY

Investment Summary

Item	Description
Company	Lumecon Inc.
Entity Type	Delaware C-Corporation

Financing Instrument	Y Combinator Post-Money SAFE (Valuation Cap, No Discount)
Valuation Cap	\$5,000,000 Post-Money
Raise Target	Up to \$100,000
Founder Capital Committed	\$50,000
Founder Capital Deployed	\$25,000
Company Founded	January 2026
Corporate Conversion	May 2026

COMPANY HISTORY

Company History

Lumecon originated as Moreno Ventures LLC in December 2025 and began operations on January 1, 2026. In May 2026, the company converted into Lumecon Inc., a Delaware corporation. The founders have personally committed \$50,000 in capital to support development, infrastructure, legal formation, product development, and commercialization, of which \$25,000 has been deployed. The company has also received a \$6,000 Human Spirit Fellowship through Cornell University's Entrepreneurship Hub and has been accepted into the Cornell Law School Entrepreneurship Legal Clinic.

THE PROBLEM

The Problem

Economic impact analysis is expensive, consultant-dependent, hard to update, and inaccessible to many of the organizations that need it most. Organizations face layered costs before they ever see a study. Software licenses can range from roughly \$7,500 to more than \$65,000 a year. Consulting engagements add tens of thousands of dollars beyond the license. Internal staff time goes to collecting, cleaning, and organizing

data. Update cycles bring the bill back every time a study needs to be refreshed. For many organizations, the practical cost of one professional economic impact study can clear \$25,000 to \$100,000, and many organizations that would benefit from economic impact analysis simply do not participate in the market. The existing customer base reflects organizations that can afford current solutions, not organizations that need them.

MARKET VALIDATION

Market Validation

Economic impact analysis is an established software category with demonstrated demand. In 2024, private equity firm Charlesbank Capital Partners acquired IMPLAN, one of the largest economic impact analysis software providers in the United States. IMPLAN reports serving more than 900 organizations; REMI reports serving more than 200. Together they demonstrate existing customer demand, recurring software revenue, institutional adoption, strategic acquisition interest, and long-term market viability. These customer counts only represent organizations that can currently afford existing solutions, and the addressable market is substantially larger.

WHY THE MARKET IS LARGER THAN IT LOOKS

Why the Market Is Larger Than It Looks

Most economic impact software providers serve organizations with substantial budgets, internal technical expertise, or access to consulting support. Many governments, nonprofits, tribal organizations, foundations, and mission-driven institutions are priced out. Lumecon's strategy is to expand access rather than compete for the customers already served. By reducing both software costs and workflow costs through automation, AI-assisted workflows, integrated reporting, and modern infrastructure, we make economic impact analysis accessible to organizations that previously could not justify the expense. Our objective is not just to capture market share. It is to expand the market itself.

WHY TRIBAL MARKETS MATTER

Why Tribal Markets Matter

Tribal Economic Impact is not merely a vertical adaptation; it is a strategic entry point. Our internal review identified more than fifty publicly available tribal economic impact studies commissioned between roughly 2000 and 2026 by tribal governments, tribal enterprises, Native nonprofits, intertribal organizations, tribal colleges, gaming organizations, and Native-serving institutions. The public record likely understates total demand because many tribal studies stay unpublished or circulate only internally, and several organizations appear repeatedly throughout the record, suggesting recurring demand rather than one-time use. Economic impact analysis functions as an ongoing planning, reporting, advocacy, accountability, and funding tool, not a one-time consulting product. Lowering cost and increasing accessibility increases both update frequency and market participation. If we solve the hardest geographic and institutional problems first, broader expansion gets substantially easier.

PRODUCT VISION

Product Vision

Lumecon is not replicating existing economic impact software. We are building a next-generation platform centered on modern cloud-native infrastructure, AI-assisted workflows, tribal-specific modeling, reservation-level analysis, alternative data integration, organizational memory systems, compliance support, transparent assumptions, and automated reporting. Over time, we expect to incorporate additional data sources including mobility data, satellite-derived indicators, shipping and logistics information, utility and infrastructure data, administrative datasets, and other emerging alternative data. These data sources create opportunities to measure economic activity across geographies that do not align with traditional political boundaries, including tribal reservations, congressional districts, economic development zones, service areas, watersheds, and multi-jurisdictional regions.

PRODUCT ROADMAP

Product Roadmap

2026 · Local Economic Impact. Serves cities, counties, state agencies, universities, foundations, enterprises, and nonprofits. Coverage: county, state, and national.

2026 · Tribal Economic Impact. Serves tribal governments, tribal enterprises, Native nonprofits, tribal colleges, Alaska Native Corporations, Native Hawaiian Organizations, Native CDFIs, and Native-entity federal contractors. Coverage: reservation, county, state, and national. Unlike conventional systems adapted from state-level models, Tribal Economic Impact is designed around tribal institutions and Indigenous data sovereignty from inception.

2026 · Cedar. Lumecon's AI-assisted workflow and agent platform. Capabilities include source document organization, data extraction, assumption tracking, audit trail creation, workflow automation, and reporting assistance.

2027 · Cedar Grove. Lumecon's organizational intelligence layer. Capabilities include data harmonization, compliance support, centralized repositories, organizational memory, longitudinal reporting, and multi-study management. The goal is to transform economic impact analysis from a one-time report into a continuously maintained organizational asset.

2028 · Global Economic Impact. Extends Lumecon's framework to national, international, cross-border, and supply-chain analysis. Most early demand will be United States based, but the long-run opportunity extends far beyond.

COMPETITIVE ADVANTAGES

Competitive Advantages

Underserved customer focus. Lumecon focuses on organizations that have historically been priced out of the market, not on customers existing

providers already serve.

Tribal expertise. Deep expertise in tribal governments, Native economies, reservation geography, and Indigenous data governance, with team members drawn from the Federal Reserve System's Center for Indian Country Development and other Native-policy institutions.

Geographic flexibility. Designed to support analysis across complex and overlapping geographies, not just conventional administrative boundaries.

Alternative data integration. Future incorporation of alternative datasets creates opportunities to improve geographic precision and reduce reliance on modeling assumptions.

AI-assisted workflows. Cedar reduces the labor burden traditionally associated with economic impact analysis.

Organizational memory. Cedar Grove creates long-term switching costs by helping organizations retain and reuse institutional knowledge across studies.

Intellectual property. The company intends to actively develop and protect proprietary methodologies, workflows, technologies, and software systems through patents, copyrights, trademarks, trade secret protections, and contractual safeguards where appropriate.

REVENUE MODEL

Revenue Model

Local Economic Impact

Tier	Annual price
Sprout	\$7,500
Sapling	\$15,000
Tree	\$20,000

Tribal Economic Impact

Tier	Annual price
Sprout	\$10,000
Sapling	\$17,500
Tree	\$25,000

Arborist (Consultant plan)

A project-based plan for consulting firms running studies on behalf of outside clients. \$15,000 flat for two projects in one engagement, renewable as a fresh engagement when those wrap up. Cedar, Cedar Grove, and the Toolbox add-on are not part of this plan.

Toolbox

A \$15,000 add-on. Converts platform outputs into publication-ready deliverables: a full written report, a presentation deck, an executive summary, an assumption ledger, source documentation, and a media-ready findings sheet. Three rounds of revisions included. Recommended pairing is the Tree tier so deliverables pick up the customer's custom branding automatically.

COMMERCIALIZATION STRATEGY

Commercialization Strategy

Initial commercialization focuses on tribal governments, Native organizations, economic development organizations, local governments, universities, and foundations. Pilot deployments begin in 2026. Early revenue is expected to come from economic impact studies, pilot implementations, and software subscriptions. Revenue generated during early commercialization will be reinvested into engineering, infrastructure, intellectual property protection, data acquisition, customer support, and platform expansion.

TEAM

Team

Lumecon combines expertise from Cornell University, Dartmouth College, Duke University, Oxford University, Brown University, Yale University, Massachusetts Institute of Technology, the Federal Reserve System, and the Center for Indian Country Development. The team brings expertise in public policy, economic development, econometrics, software engineering, artificial intelligence, tribal finance, data governance, and research operations.

USE OF FUNDS

Use of Funds

SAFE proceeds will support engineering (platform development, product refinement, customer features), infrastructure (cloud computing, storage, monitoring, security), artificial intelligence (Cedar development, agent systems, token and inference costs), economic modeling (refinement, validation, tribal adaptation), intellectual property (patent filings, trademark protection, copyright registration), commercialization (pilot implementation, customer onboarding, sales and marketing support), and legal and compliance activities (corporate governance, customer contracting, financing documentation).

CLOSING

Closing

Economic impact analysis has already demonstrated its value through decades of use across governments, nonprofits, universities, tribal nations, enterprises, and foundations. The question is no longer whether economic impact analysis matters. The question is who has access to it. Lumecon is building software designed to expand access, reduce costs, improve transparency, and create new opportunities for the organizations the current market underserves.

Our goal remains simple.

Make the economically invisible visible.
