

INVESTOR MEMORANDUM · SUMMER 2026 · CONFIDENTIAL

An investor memorandum for Lumecon.

Software-first economic impact analysis for the organizations the current market underserves. Built for governments, tribal nations, nonprofits, universities, foundations, enterprises, and the consultants who serve them.

EXECUTIVE SUMMARY

Executive Summary

Lumecon is the software platform that makes economic impact analysis accessible to the organizations the current market underserves. The category is proven, the entry point is the most technically demanding segment of it, and the underlying technology shift makes building this company possible now in a way it was not five years ago.

Make the economically invisible visible.

The company is currently raising up to \$100,000 in SAFE financing at a \$5,000,000 post-money valuation cap to accelerate product development, pilot implementation, intellectual property protection, and commercialization. The founders have personally committed \$50,000 in capital, with \$25,000 already deployed.

PRODUCT
DASHBOARD

Lumecon dashboard. A completed economic impact run with jobs, labor income, output, tax impact, and export options on a single screen.

INVESTMENT SUMMARY

Investment Summary

Item	Description
Company	Lumecon Inc.
Entity Type	Delaware C-Corporation
Financing Instrument	Y Combinator Post-Money SAFE (Valuation Cap, No Discount)
Valuation Cap	\$5,000,000 Post-Money
Raise Target	Up to \$100,000
Founder Capital Committed	\$50,000
Founder Capital Deployed	\$25,000
Company Founded	January 2026
Corporate Conversion	May 2026

WHY NOW

Why Now

Three things converged in the last 24 months that make this company possible to build now.

AI can do the repetitive part of professional knowledge work. Recent labor-economics research finds that the share of professional work theoretically exposed to current AI systems substantially exceeds what is being adopted in practice. Economic impact analysis sits in that gap. The work is heavy on document intake, harmonization, assumption tracking, charting, and report writing, all of which are on the productive side of the adoption curve.

Existing providers have not modernized. IMPLAN and REMI operate on workflows that predate the cloud. The market leaders prove demand and validate willingness to pay, but their stacks were built when desktop software was the assumption. The gap between what current technology can support and what shipped product offers is unusually wide.

Customers want experts plus AI, not black-box outputs. Governments, tribes, foundations, and grantmakers cannot accept a number they cannot defend. Lumecon sits between AI-only tools and traditional consultants. AI handles intake, harmonization, and drafting; the analyst stays accountable for every assumption.

This is not a "use AI for X" story. It is a "modernize a stagnant category" story where AI is one of several enabling shifts.

MARKET OPPORTUNITY

Market Opportunity

The addressable customer set is large, recurring, and fragmented enough that no single incumbent has consolidated it.

575	200+
federally recognized tribes	Alaska Native Corporations and related entities
3,000+	50
U.S. counties	U.S. states
19,000+	86,000+
incorporated cities, towns, and villages	nonprofits with annual revenue over \$1M
4,000+	1.8M+
accredited colleges and universities	private-sector establishments above 50 employees

Existing providers serve more than 1,100 organizations between IMPLAN (900+) and REMI (200+). Charlesbank Capital Partners acquired IMPLAN in 2024, confirming category demand and acquisition interest. The customer counts above demonstrate willingness to pay, not the boundary of the market. Most of the organizations listed have never run an economic impact study because the practical cost of one is \$25,000 to \$100,000 once software, consulting, and internal staff time are added together. Lumecon's pricing structure breaks below that floor and turns one-time studies into a continuously refreshed planning tool.

THE PROBLEM

The Problem

Economic impact analysis today is a months-long project with a five-figure-per-study price tag. Lumecon turns the same work into a repeatable software workflow.

TODAY

Months of consultant time.

- A consultant is hired, or a desktop software license is opened.
- Data is collected by hand from spreadsheets, PDFs, and emails.
- Inputs are cleaned and harmonized manually.
- Multipliers are picked one by one. Assumptions are typed into the report margin.
- Charts are built by hand. A senior analyst writes the report.
- The deck is formatted overnight. Revisions take a week each.
- Every refresh starts over and is billed again.

WITH LUMECON

Minutes of platform time.

- The workspace opens to a clean study setup.
- PDFs, CSVs, and XLSX files are dropped into Cedar.
- Cedar structures inputs against public data automatically.
- Every assumption Cedar surfaces is reviewable and overridable.
- Branded report, deck, and executive summary export in one click.
- Revisions are a re-run, not a re-engagement.
- Refresh quarterly without reopening a contract.

The legacy stack charges per geography, per user, per data tier. Then the consultants who operate it charge by the hour, with junior analysts running the model and senior analysts writing the report. Update cycles bring the bill back every time the data needs to be refreshed.

Lumecon collapses both layers. One annual subscription, unlimited studies, every geography included, Cedar handling the intake and the drafting, and human review focused on the judgment calls that actually need a human.

PRODUCT
STUDY SETUP

New study setup. Pick the geography, the time window, the project type, and the data sources, and Cedar prepares the workspace.

WHY TRIBES FIRST

Why Tribes First

Tribal economies are among the most difficult economic environments to model accurately in the United States. Reservations, off-reservation trust lands, overlapping jurisdictions, sovereign governments, rural geography, Alaska Native Corporation regions, Native Hawaiian Home Lands, and Indigenous data sovereignty requirements together create a problem that the major incumbents handle by approximating reservations as counties and hoping nobody asks.

Solving these problems first creates infrastructure that deploys directly into broader markets. The geographic engine, the data sovereignty controls, the institutional flexibility, and the multi-jurisdictional reasoning are exactly what cities, foundations, federal agencies, and international clients need. Tribes are the strategically right entry point because they force the hardest version of the problem to be solved first.

The same review that identified 50+ public tribal impact studies between 2000 and 2026 also showed several organizations commissioning studies repeatedly, which means tribal demand is recurring rather than one-time. That recurring footprint is the early-customer base that funds the broader expansion.

PRODUCT

GEOGRAPHY SELECTOR

Geography selector. Reservation, off-reservation trust land, Alaska Native regional and village corporations, and Native Hawaiian Home Lands as first-class geographies.

PRODUCT

Product

Three regional platforms on one engine. Local Economic Impact for cities, counties, and state agencies. Tribal Economic Impact for tribal governments, enterprises, and Native organizations. Global Economic Impact, launching in 2028, for cross-border and supply-chain analysis. Every platform runs the same modeling backbone and the same three-tier ladder (Sprout, Sapling, Tree).

Cedar. Lumecon's AI-assisted workflow. Cedar uploads and processes data in PDF, CSV, and XLSX formats today, with more formats expanding over time. It structures inputs against public data sources, surfaces every modeling assumption for human sign-off, and acts as a thought partner on the write-up. Cedar is not a ghostwriter. The analyst stays accountable for the substance.

PRODUCT

CEDAR UPLOAD

Cedar upload and review queue. Drop in PDFs, CSVs, and XLSX files; Cedar extracts fields and stages them for human review.

Cedar Grove. Launches in 2027 as the organizational intelligence layer. Customer data stays harmonized across every study a customer runs. Complementary administrative datasets (employment shifts, business openings and closures, wage movements, transfer-payment flows) sit alongside the customer's own data, so each study reinforces the impact narrative with real outcome evidence rather than only modeled multipliers. Recurring submissions (grants, federal reporting, audited annual reports) start from a base that already passed review.

Arborist and Toolbox. Arborist is the consultant plan, project-based, \$15,000 flat for two projects in one engagement, renewable as a fresh engagement when those wrap up. Toolbox is a \$15,000 add-on that pairs the platform with our team for finished publication-ready deliverables.

THE MOAT

The Moat

The defensibility is layered, and each layer compounds on the one below it.

Layer 1. Tribal and Native-economy expertise. Founders and senior team members carry direct experience at the Federal Reserve Bank of Minneapolis Center for Indian Country Development, the National Congress of American Indians, and through original work like the Native Entity Enterprise dataset. The category leaders do not have this expertise and cannot acquire it quickly.

Layer 2. Complex-geography engine. Reservations, trust lands, congressional districts, economic development zones, service areas, watersheds, and multi-jurisdictional regions are first-class

geographies. This is infrastructure that is hard to retrofit into legacy systems.

Layer 3. Reusable data infrastructure. Cleaning and harmonizing public, alternative, and administrative datasets happens once. Every customer benefits. Every new dataset added widens the lead.

Layer 4. Cedar Grove and customer switching costs. Once a customer has built up a harmonized data layer, a curated source library, an assumption history, and recurring report templates inside Cedar Grove, switching providers means rebuilding institutional memory. The longer a customer is on the platform, the more expensive that decision becomes.

Layer 5. Privacy-preserving learning, on the roadmap. The architecture is designed to support federated learning so models can improve from cross-customer signals without raw data ever leaving a customer's workspace. This preserves Indigenous data sovereignty by design and creates a network effect that is hard to replicate without the same architectural commitments.

Patents, trademarks, copyrights, and trade secret protections sit on top of these layers as a procedural moat, not the primary one.

ROADMAP

Roadmap

2026	Local Economic Impact launches. Coverage: county, state, national.
2026	Tribal Economic Impact launches. Coverage: reservation, county, state, national.
2026	Cedar launches as the AI workflow inside Sapling and Tree tiers.
2027	Cedar Grove launches as the organizational intelligence layer on Tree.
2028	Global Economic Impact launches. National, international, cross-border, and supply-chain analysis.

REVENUE MODEL

Revenue Model

Local Economic Impact		Tribal Economic Impact	
Tier	Annual price	Tier	Annual price
Sprout	\$7,500	Sprout	\$10,000
Sapling	\$15,000	Sapling	\$17,500
Tree	\$20,000	Tree	\$25,000

Arborist. \$15,000 flat for two projects in one engagement, renewable as a fresh engagement. Built for consulting firms.

Toolbox. \$15,000 add-on. Team-produced finished deliverables with three rounds of revisions, paired with Tree so deliverables pick up the customer's custom branding automatically.

PRODUCT
REPORT PDF

Exported PDF report. Branded to the customer's visual identity with the assumption ledger embedded.

Exported slide deck. Same numbers, different framing, ready for council, board, or funder audiences.

USE OF FUNDS

Use of Funds

Category	Amount	Detail
Contractors	\$50,000	Six months of work. Economist, two data scientists, and software engineer at 8 to 12 hours a week.
Legal, compliance, IP	\$30,000	Corporate governance, customer contracting, financing documentation, patents, trademarks, and copyrights.
Infrastructure	\$10,000	Cloud computing, storage, monitoring, and security.
Marketing, customer acquisition, piloting	\$10,000	Pilot implementation, customer onboarding, sales, and marketing.
Total	\$100,000	

TEAM

Team

Investors invest in teams. This one is the strongest part of the company.

CO-FOUNDER & CEO**Elijah Moreno, MPP**

Cornell PhD candidate. Dartmouth Economics. Federal Reserve CIGD. NCAI Mankiller Fellow. Native Entity Enterprise dataset.

ECONOMICS LEAD**Laurel Wheeler, PhD**

Duke PhD in Economics. Oxford MSc. Federal Reserve CIGD economist. Native CDFI lending researcher.

INPUT/OUTPUT ENGINE LEAD**Isabella Agnes**

Wisconsin Math + Economics. Maryland doctoral. Federal Reserve Board. Federal Reserve Philadelphia.

CEDAR LEAD**Francesca Agnes**

Illinois Urbana-Champaign. Leads Cedar, the AI assistant for source intake and assumption tracking.

PLATFORM LEAD**Kaylyn Lee**

Cornell Computer Science with Business. Leads the customer-facing platform end to end.

METHODOLOGY ADVISOR**Vod Vilfort**

MIT PhD candidate in econometrics. Yale Economics and Mathematics. AER: Insights, 2025.

TECHNICAL ADVISOR**Brian Kim**

Dartmouth Economics. Senior engineer at Mody and Chime. Architecture, Cedar, and security.

PRODUCT, DATA SECURITY & RESEARCH OPS ADVISOR**Havala Hanson, PhD**

Alaska Fairbanks PhD in Statistics. Brown MA. Data governance for sensitive administrative datasets.

CO-FOUNDER & FOUNDING INVESTOR**Michael Moreno**

Moved the company from concept to product through founding capital and early-stage support.

CORNELL · DARTMOUTH · YALE · DUKE · MIT · OXFORD · BROWN · UNIVERSITY OF WISCONSIN-MADISON · UNIVERSITY OF MARYLAND · UNIVERSITY OF ALASKA FAIRBANKS · FEDERAL RESERVE SYSTEM · CENTER FOR INDIAN COUNTRY DEVELOPMENT

CLOSING

Closing

Economic impact analysis is a proven category with stagnant incumbents, a customer base limited by price rather than need, and an underlying technology shift that makes the next generation of platforms possible to build. The strategically correct entry point is the segment that current providers handle worst, which is tribal economies and the complex geographies that come with them. Solving for that segment produces infrastructure that deploys directly into the rest of the market.

The question is no longer whether economic impact analysis matters. The question is who has access to it.

Make the economically invisible visible.
